AgonProject

The online platform for exploring approaches to formal argumentation

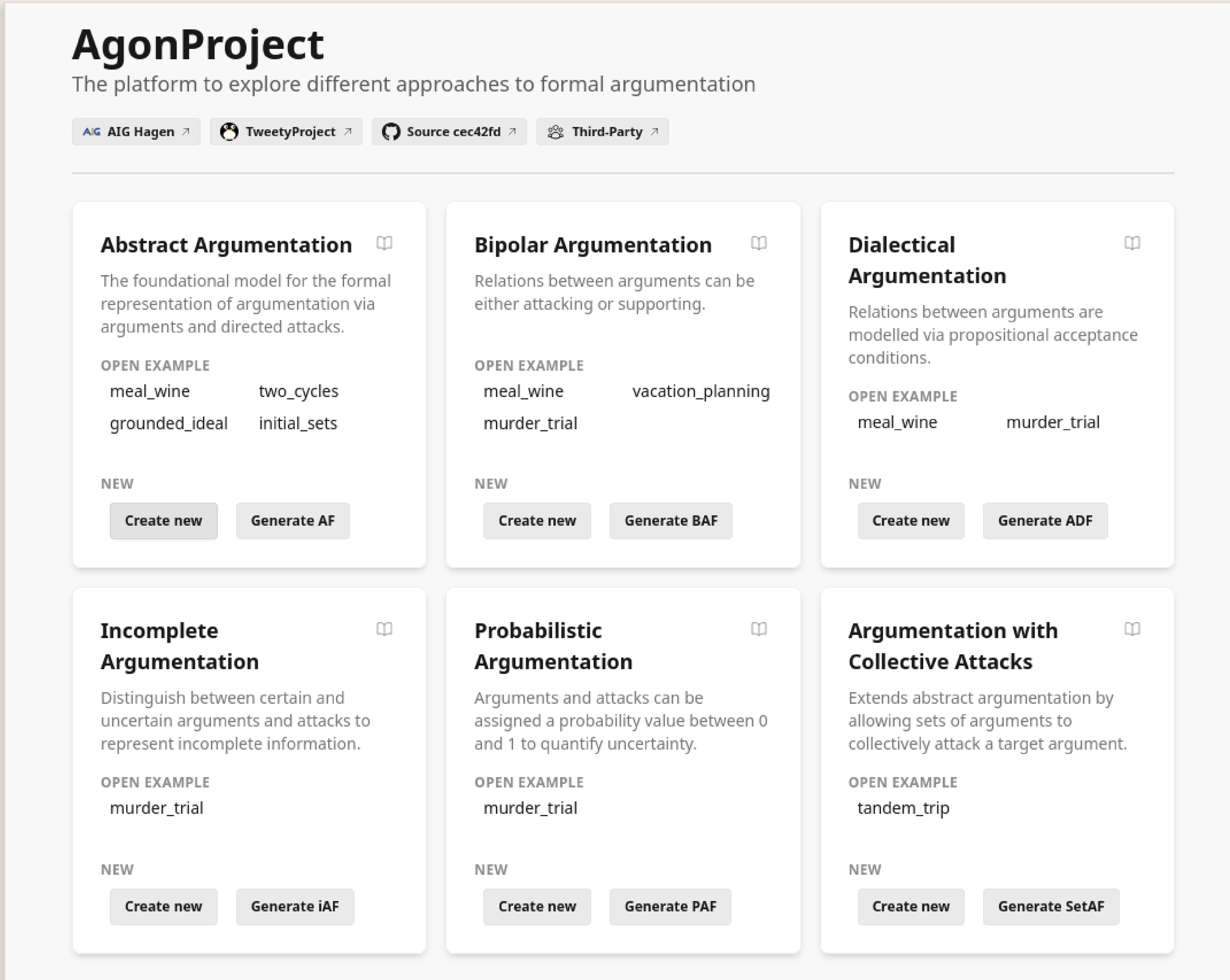
POWERED BY
TweetyProject
reasoning libraries & solvers

WEB PLATFORM • OPEN SOURCE

The zoo of formal argumentation, in one browser tab.

AgonProject is an easy-to-use, **visual** web interface for building, evaluating, and comparing argumentation frameworks. It supports **6** different argumentation formalisms and **more than 25** semantics, powered by the TweetyProject argumentation libraries. Curated examples, formal definitions, and literature references support both students and researchers working with formal argumentation.

SCAN TO TRY IT LIVE
agon.tweetyproject.org



Landing page — 6 different formalisms, with curated examples and random generation.

FEATURES

Construct
Interactive graph editor with automatic layouts and physics simulation.

Evaluate
Extension- and ranking-based semantics, with enumeration and credulous / skeptical acceptance.

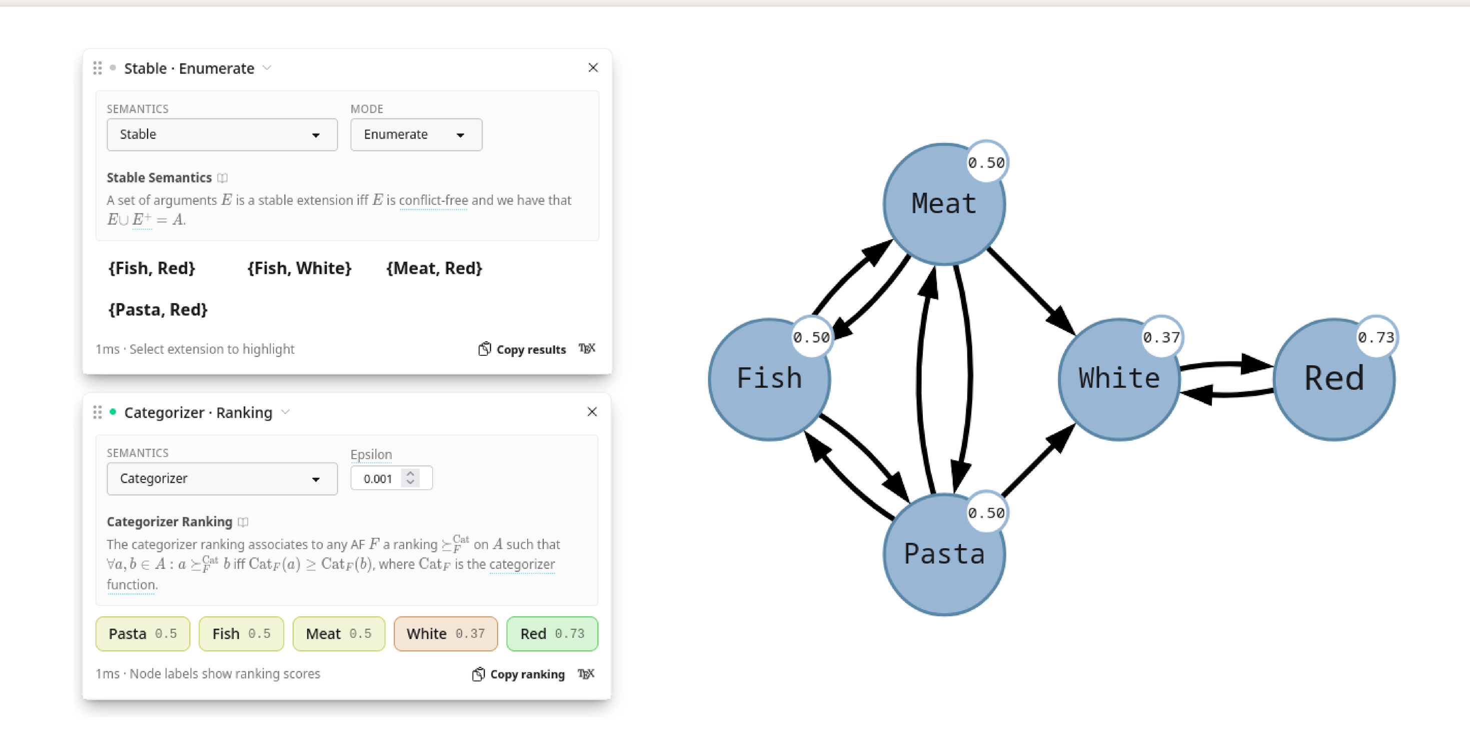
Export & share
Export to LaTeX, SVG, TGF, and the ICCMA AF format, or share by URL.

Generate
Random frameworks from **8** configurable graph generators.

Learn
10+ tutorials and a glossary with definitions and literature references.

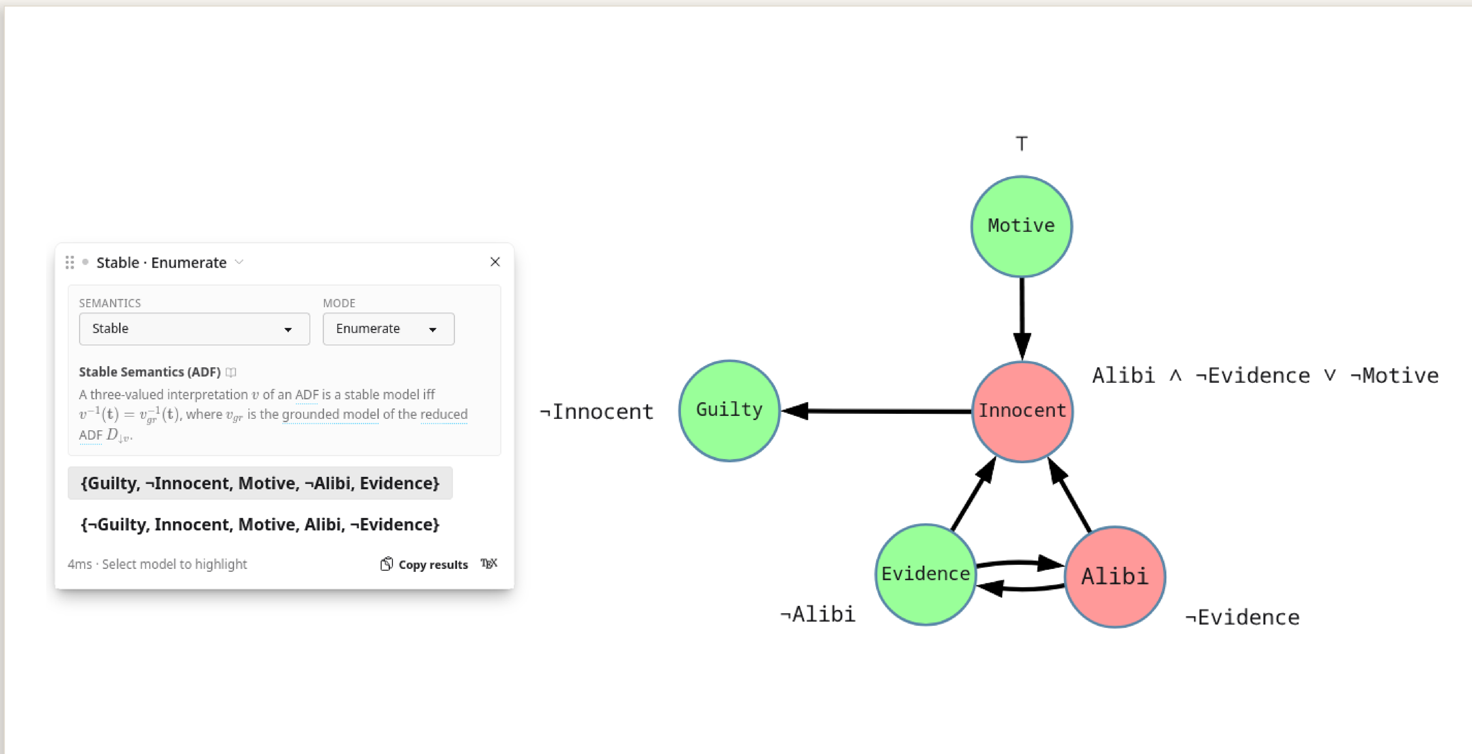
IN ACTION

Extension & Ranking Semantics



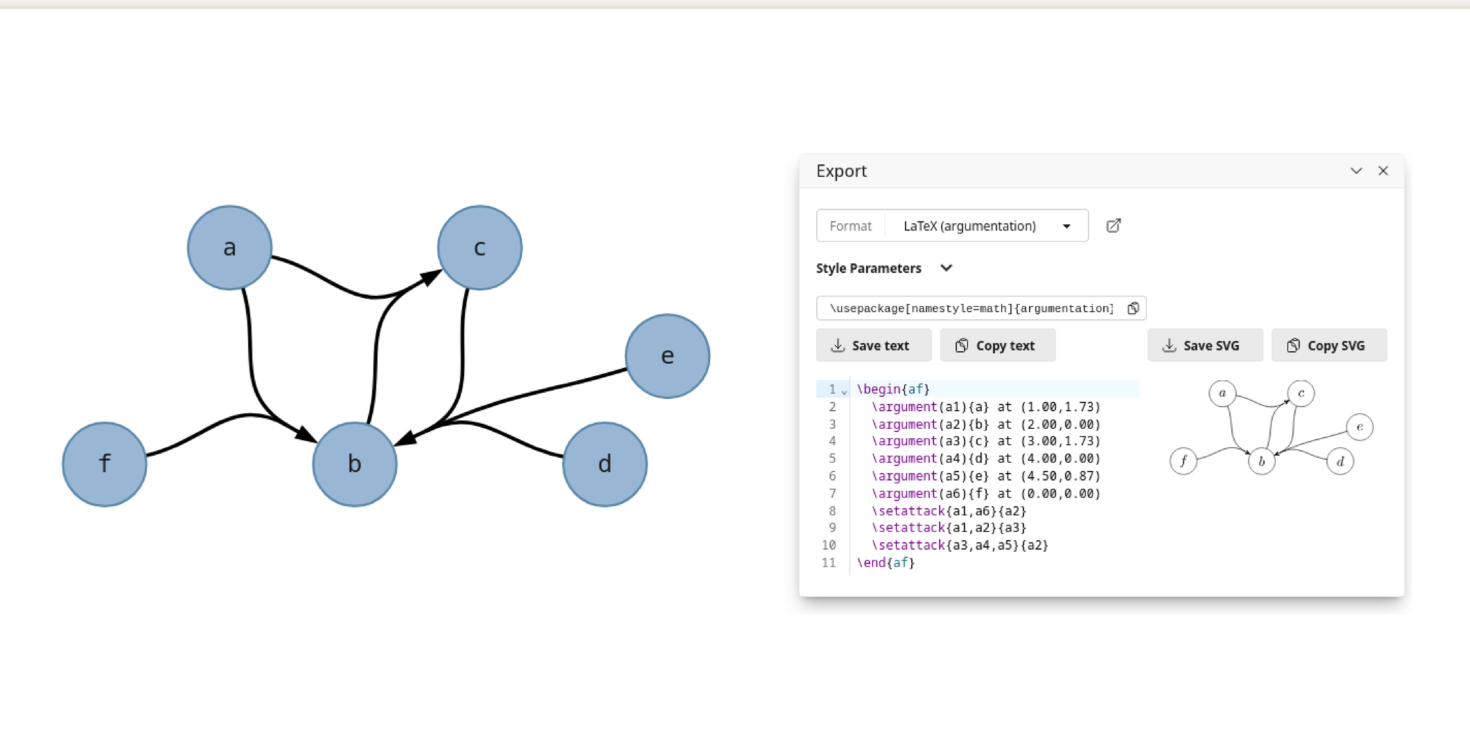
Preferred extensions enumerated; the categoriser ranking annotated on each argument.

ADFs & Highlighting



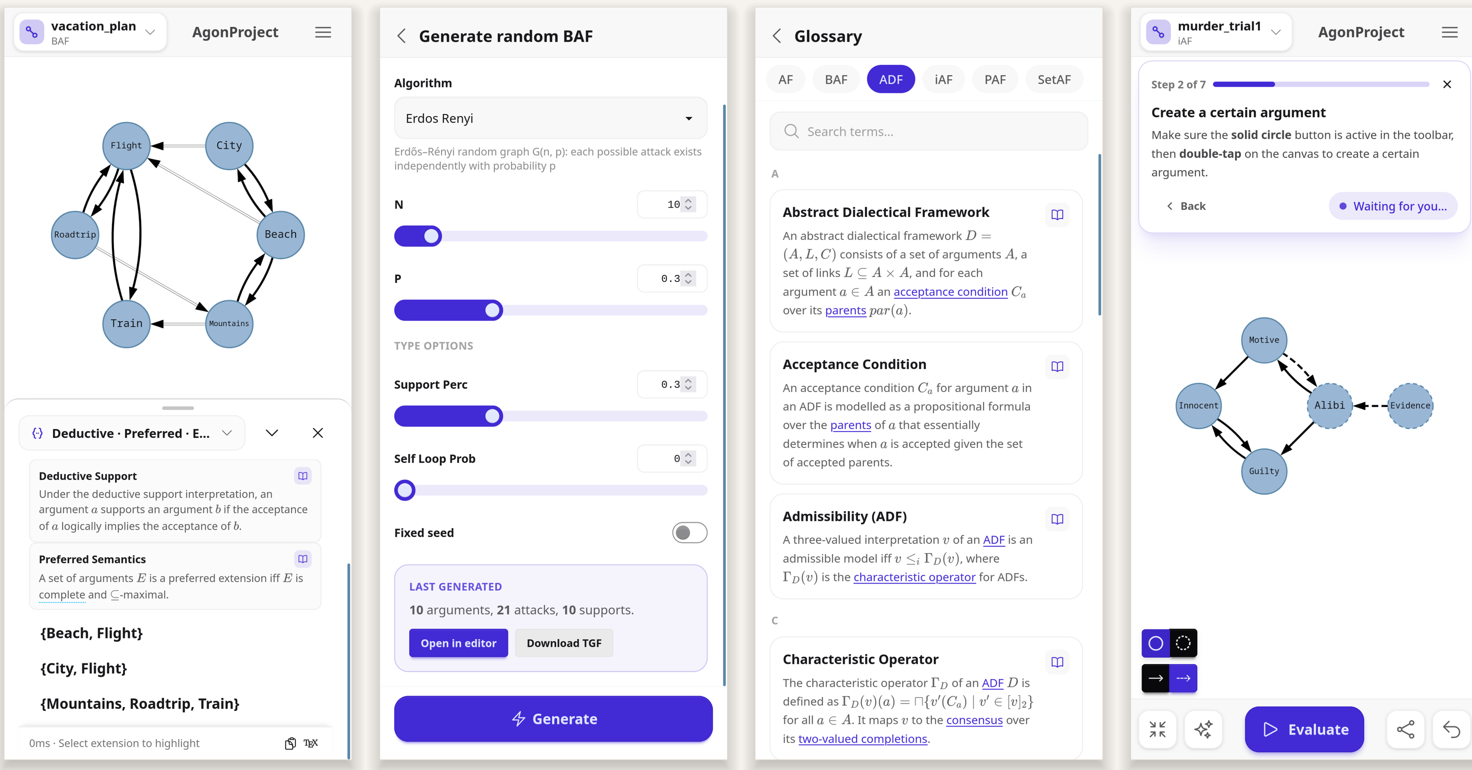
ADFs attach propositional conditions to arguments; a stable model is highlighted in the graph.

Collective attacks & Exporting



Set-attacks drawn as hyperedges; the export panel emits ready-to-use LaTeX with an SVG preview.

Dedicated mobile UI



Fully responsive: evaluation sheet, random generation, glossary, and guided tutorials.

SUPPORTED SEMANTICS

Classical	conflict-free, admissible, complete, grounded, preferred, stable
Admissibility-based	ideal, semi-stable, eager, strong admissibility, initial sets, …
Non-admissible	naive, CF2, SCF2, stage, stage2, (strongly) undisputed
Meta-families	weak admissibility, (semi-)qualified, vacuous-reduct, serialisable
Argument-rankings	burden, categoriser, counting, discussion, iterated graded defense, probabilistic, propagation, serialisability, strategy-based, …

OUTLOOK

- more formalisms, e. g., **ABA**, **weighted AFs**, **BSAFs**, **claim-augmented AFs**
- benchmark generators from the ICCMA ecosystem
- other reasoning approaches, e. g., acceptance explanations

AgonProject is backend-agnostic and open to new formalisms and solvers.
